Support Vector Machines: Optimal Hyperplanes

CS4780/5780 – Machine Learning Fall 2013

> Thorsten Joachims Cornell University

Reading: Schoelkopf/Smola Chapter 7.1-7.3, 7.5

Example: Reuters Text Classification

Optimal Hyperplanes

- Assumption:
 - Training examples are linearly separable.

Hard-Margin Separation

• Goal:

 Find hyperplane with the largest distance to the closest training examples.

Optimization Problem (Primal):

$$\min_{\substack{\vec{w},b \\ s.t.}} \quad \frac{1}{2} \vec{w} \cdot \vec{w} \\ y_1(\vec{w} \cdot \vec{x}_1 + b) \ge 1 \\ \dots$$

- Support Vectors:
 - Examples with minimal distance (i.e. margin).

 $y_n(\vec{w}\cdot\vec{x}_n+b)>1$

Non-Separable Training Data

- Limitations of hard-margin formulation
 - For some training data, there is no separating hyperplane.
 - Complete separation (i.e. zero training error) can lead to suboptimal prediction error.

Soft-Margin Separation

Idea: Maximize margin and minimize training

Hard-Margin OP (Primal): $\begin{array}{l} \min \\ \vec{w}, b \\ s.t. \\ y_1(\vec{w} \cdot \vec{x}_1 + b) \geq 1 \\ \dots \\ y_n(\vec{w} \cdot \vec{x}_n + b) \geq 1 \end{array}$

Soft-Margin OP (Primal):

$$\min_{\vec{w},\vec{\xi},b} \frac{1}{2} \vec{w} \cdot \vec{w} + C \sum_{i=1}^{n} \xi_i$$
s.t. $y_1(\vec{w} \cdot \vec{x}_1 + b) \ge 1 - \xi_1 \land \xi_1 \ge 0$
...
 $y_n(\vec{w} \cdot \vec{x}_n + b) \ge 1 - \xi_n \land \xi_n \ge 0$

- Slack variable ξ_i measures by how much (x_i, y_i) fails to achieve margin δ
- $\Sigma \xi_i$ is upper bound on number of training errors
- *C* is a parameter that controls tradeoff between margin and training error.

Controlling Soft-Margin Separation

- $\Sigma \xi_i$ is upper bound on number of training errors
- C is a parameter that controls trade-off between margin and training error.

Soft-Margin OP (Primal):

$$\min_{\vec{w},\vec{\xi},b} \frac{1}{2} \vec{w} \cdot \vec{w} + C \sum_{i=1}^{n} \xi_i$$
s.t. $y_1(\vec{w} \cdot \vec{x}_1 + b) \ge 1 - \xi_1 \land \xi_1 \ge 0$
...
 $y_n(\vec{w} \cdot \vec{x}_n + b) \ge 1 - \xi_n \land \xi_n \ge 0$

Example Reuters "acq": Varying C

Example: Margin in High-Dimension

Training	\vec{x}							у
Sample S _{train}	x_1	x_2	x_3	x_4	x_5	x_6	x_7	
(\vec{x}_{1}, y_{1})	1	0	0	1	0	0	0	1
(\vec{x}_{2}, y_{2})	1	0	0	0	1	0	0	1
(\vec{x}_{3}, y_{3})	0	1	0	0	0	1	0	-1
(\vec{x}_4, y_4)	0	1	0	0	0	0	1	-1
	$ec{w}$							b
	<i>w</i> ₁	<i>w</i> ₂	w ₃	w ₄	<i>w</i> ₅	<i>w</i> ₆	<i>w</i> ₇	
Hyperplane 1	1	1	0	0	0	0	0	2
Hyperplane 2	0	0	0	1	1	-1	-1	0
Hyperplane 3	1	-1	1	0	0	0	0	0
Hyperplane 4	0.5	-0.5	0	0	0	0	0	0
Hyperplane 5	1	-1	0	0	0	0	0	0
Hyperplane 6	0.95	-0.95	0	0.05	0.05	-0.05	-0.05	0
